Digital Credentials
Enabling Mobility and Verification of Educational Achievements

Brandon Muramatsu, MIT
Willem van Valkenburg, Delft University of Technology
Today

- A brief intro to the Digital Credentials Consortium
- Two case studies
  - GDPR and Digital Credentials, Delft University of Technology
  - Open Source Learner Credential Wallet, MIT
Digital Credentials Consortium

Our mission is to create a trusted, distributed, and shared infrastructure that will become the standard for issuing, storing, displaying, and verifying academic credentials, digitally.
DCC Founding Members

Delft University of Technology (The Netherlands)
Georgia Institute of Technology (USA)
Harvard University (USA)
Hasso Plattner Institute, University of Potsdam (Germany)
Massachusetts Institute of Technology (USA)
McMaster University (Canada)
Tecnológico De Monterrey (Mexico)
Technical University of Munich (Germany)
University of California at Berkeley (USA)
University of California, Irvine (USA)
University of Milano-Bicocca (Italy)
University of Toronto (Canada)
DCC Guiding Principles

Learners

- Learners retain primary control over their credentials.
- Learners’ consent is required for issuance of digital credentials.
- Learners decide to whom they grant access.
- Barriers to receiving and managing credentials are minimal to enable broad participation.

Issuers

- Issuers control to whom they issue credentials, the particular achievement that the credential represents, and which credential options are available to the learner.
- Issuers can revoke credentials according to their institution’s policies.
- Barriers to issuing credentials are minimal to enable broad and diverse participation.

Trust:

- Everyone is able to review how the infrastructure and processes work.
- Trust in the integrity of the credentials is established cryptographically.
- **Credentials can be verified without consulting the original issuer.**
How does DCC do its work?

- Consortium of members with alignment to guiding principles, and each working in similar ways on digital credentials
- DCC does its work through open standards organizations primarily the **W3C Verifiable Credentials for Education (W3C VC-EDU) Community Group**
  - Coordinates with IMS Global on Comprehensive Learner Record and Open Badges v3 specifications
- Shared technical work through a Technical Working Group made up of DCC members
- Implementing **Verifiable Credentials (VC)** and **Decentralized Identifiers (DID)** specifications
  - Meet key DCC guiding principles of learner control

General Data Protection Regulation and Blockchain
General Data Protection Regulation (GDPR)

The European Union's General Data Protection Regulation become binding in May 2018.

Goal of GDPR:

1. to facilitate free movement of personal data between EU members states
2. to establish a framework of fundamental data rights protection.

The legal framework creates a number of obligations resting on data controllers (entities determining the means and purpose of data processing)

The legal framework creates a number of rights to data subjects (the natural persons to whom the personal data relates) to be enforced by data controllers. E.g. Article 16 GDPR – right to rectification, Article 17 GDPR – right to erasure ('right to be forgotten')
# Leading principles of GDPR

<table>
<thead>
<tr>
<th>Principle</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Lawfulness, fairness and transparency</strong></td>
<td>Organisations need to make sure their data collection practices don’t break the law and that they aren’t hiding anything from data subjects.</td>
</tr>
<tr>
<td><strong>Purpose limitation</strong></td>
<td>Organisations should only collect personal data for a specific purpose, clearly state what that purpose is, and only collect data for as long as necessary to complete that purpose.</td>
</tr>
<tr>
<td><strong>Data minimisation</strong></td>
<td>Organisations must only process the personal data that they need to achieve its processing purposes.</td>
</tr>
<tr>
<td><strong>Accuracy</strong></td>
<td>The accuracy of personal data is integral to data protection. The GDPR states that “every reasonable step must be taken” to erase or rectify data that is inaccurate or incomplete.</td>
</tr>
<tr>
<td><strong>Storage limitation</strong></td>
<td>Organisations need to delete personal data when it’s no longer necessary.</td>
</tr>
<tr>
<td><strong>Integrity and confidentiality (security)</strong></td>
<td>Personal data should be processed in a manner that ensures appropriate security of the personal data, including protection against unauthorised or unlawful processing and against accidental loss, destruction or damage, using appropriate technical or organisational measures.</td>
</tr>
<tr>
<td><strong>Accountability</strong></td>
<td>The controller shall be responsible for, and be able to demonstrate compliance with the above principles.</td>
</tr>
</tbody>
</table>
Fines up to EUR 20m or 4% of total worldwide annual turnover

A data protection officer has to be nominated as a fixed role

Data breaches must be reported without undue delay

Processing by third parties must be governed by contract

Develop default privacy protection mechanisms and implement monitoring processes

Much broader territorial scope

Sanctions

Explicit consent

Right of access

Right to rectification

Delete data if it is no longer required for the original purpose

Right to erasure

Right to data portability

Individuals can request copies of personal data

Figure 1: Major requirements of GDPR (summary)
The GDPR is based on assumptions that creates tension with blockchain.

<table>
<thead>
<tr>
<th>GDPR</th>
<th>Blockchain</th>
</tr>
</thead>
<tbody>
<tr>
<td>in relation to each personal data point there is at least one natural or legal person – the data controller – whom the subjects can address to enforce their rights under EU Data protection law.</td>
<td>decentralizes to many actors and allocation of responsibility and accountability is burdensome.</td>
</tr>
<tr>
<td>data can be modified or erased where necessary to comply with the legal requirements of GDPR Article 16 (right to rectification) and 17 (right to erasure (‘right to be forgotten’)</td>
<td>Modification and erasure of data is made onerous to ensure data integrity and increase trust in the network.</td>
</tr>
</tbody>
</table>
What does this look like in practice?

Accredify Portal

Hash code

BlockChain

Email SMS

Verification
By matching hash codes
Personal data on the Blockchain?

In the pilot we explored the following:

● Is data that is encrypted or hashed/ ‘anonymized’ still quality as personal data as per the GDPR requirements of anonymisation?
● How is the right to erasure/right to be forgotten dealt with in the pilot?
The right to be forgotten is not an absolute right

- If a learner requests to be forgotten, Accredify deletes their personal data. The learner is the one who should contact institutes where they have personally shared their opencert file which could still be verified.
- What happens now is that Accredify deletes personal data from their system which is GDPR complaint. This is because the right to be forgotten does not extend to all the institutes where the learner shared their file.
- If a certificate is revoked and cannot be verified in the future, that doesn’t say much – so it is good to add an explanation.

Why is my file not verified?

This could mean that the file:
1. has been tampered with
2. hasn’t been issued
3. hasn’t been issued by a registered institution
4. has been revoked or expired

Please contact your issuing institution if you face any problems with the verification status.
Hashing, salt and peppering of personal data

- As long as the hash relates to something it is not anonymised.
- This is the current conflict within blockchain and GDPR and the interpretation of what is considered as anonymous.
Open Source Learner Wallet
MIT

MIT Team
Brandon Muramatsu
Philipp Schmidt
Gillian Walsh
Dmitri Zagidulin
About the Open Source Learner Wallet Project

- A key missing ingredient in a digital credential infrastructure
  - Prioritizes learner agency
  - Enables trust
  - Supports diverse institutions

- A learner credential wallet specification (May 2021)

- An open source learner wallet mobile app, eduWallet

- A pilot with U.S. institutions:
  - College Unbound, Georgia Tech and San Jose City College
  - MIT xPRO and University of North Texas / Concentric Sky
Details on eduWallet
An Open Source Learner Wallet

● Both Android and iOS versions
  ○ Going into pilot testing December 2021–January 2022

● Key features
  ○ Login to secure wallet
  ○ **Add verifiable credentials** via deep link (direct and QR Code) and via QR code
  ○ **Display credentials locally**—Issuer, issuer logo, credential name, issuance date
  ○ **Select and share credentials** as JSON-LD via operating system sharing mechanisms (copy to clipboard, save as file)
  ○ Delete credentials, backup and restore from file
Demo

- Login to a LMS or student portal
- Prompted to install eduWallet from Apple or Google Play app stores
- First time setup of eduWallet
- (Simulated) Access credential via LMS / QR Code / Deep Link
- (Not demonstrated) Authenticate before receiving credential
- View credentials (and share them)
